EXERCISE: ML-TRAINING – CH. 1

Expected Output

1. What is the output for the given code?

main.py

```python
x = 10
y = 20
max_value = x if x > y else y
print("The greater value is:", max_value)
```

2. What is the output for the given code?

main.py

```python

numbers = [1, 2, 3, 4, 5]

for number in numbers:
    print("Current number:", number)
```

3. What is the output for the given code?

main.py

```python

number1 = 10
Number1 = 5

number1 = number1 + 5
Number1 = Number1 * 2

print("What do you think the final value of number1 is?")
print("The final result of number1 is:", number1)
```

Correct the Error

1. Please fix the syntax error here (hint: one syntax error exists).

main.py +

```python

Number1 = 5
number1 = 10

if Number1 > number1
    print("Number1 is greater than number1")
else:
    print("number1 is greater than Number1")
```

Write the complete Python code to solve the given problem

1. Write a Python program that checks if employees are eligible for a bonus based on their yearly performance scores. The bonus eligibility is determined by a score of 80 or higher.
   Your program should:
   1. Use a predefined list of performance scores (e.g., [85, 75, 90, 65]).
   2. For each score:
      - Print "Eligible for bonus" if the score is 80 or higher.
      - Print "Not eligible for bonus" if the score is less than 80.
   3. Count and display how many employees are eligible for the bonus and how many are not.

An example of the output for the given list. The program should be dynamic, meaning the list can be changed to any suitable one based on my preference

Score 85 is eligible for bonus
Score 75 is not eligible for bonus
Score 90 is eligible for bonus
Score 65 is not eligible for bonus
Total eligible for bonus: 2
Total not eligible for bonus: 2

Good Luck
